You're in Great Shape

by Kathleen Wiley

A pentagon has 5 equal sides... a hexagon has 6...
An octagon has 8 equal sides...so tell me which you pick.

RAP:
A pentagon has 5 sides....and each side is just the same size....
It's a big government building in Washington D.C...
It looks just like a house....and if I lived there as a mouse
I might just be confused because all 5 sides look the same to me!

A pentagon has 5 equal sides....a hexagon has 6....
An octagon has 8 equal sides....so tell me which you pick

RAP:
A hexagon has 6 sides....whether upside down or right side....
And each side is just the same size for our hexagon, we know...
So if hexagons are 6 sides....do you think there's a correct side?
Well, just turn it....tell us what you think....correct side? Yes or No?

A pentagon has 5 equal sides....a hexagon has 6....
An octagon has 8 equal sides....so tell me which you pick

RAP:
An octagon has 8 sides.... Spin it, turn it, where's the great side?
It's the same size all around.....so let me tell you what I know.
If octagons have 8 sides..... can you picture now a stop sign?
Because stop signs are the octagon shapes.... that tell you "Don't Go!"
